Node(String ip_name, int ip_frequency);		
Description	Constructor for individual node	
Parameters	1. Input name 2. Input frequency	1. Name for the node eg: facebook 2. Starting frequency for the node.
Return value	None	

Node fibonacci_heap.insert(Node new_node);		
Description	Insert a new node into the fibonacci heap	
Parameters	1. New node	1.
Return value	Reference of the new node	

Node fibonacci_heap.remove_max()		
Description	Remove the max node from fibonacci heap	
Parameters	None	None
Return value	Reference of the removed max node	

Node fibonacci_heap.increase_frequency(Node node, int new_frequency)		
Description	Increase frequency of a node in the fibonacci heap	
Parameters	1. node 2. New frequency	1. Reference of Node whose frequency is to be increased 2. Value by which the frequency is to be increased
Return value	Reference of the node whose frequency was increased	

void fibonacci_heap.cascading_cut(Node node_to_cut)		
Description	Start a cascading cut from given node	
Parameters	1. Node to cut	1. Node from which the cascading cut starts in the upward direction
Return value	None	

Node fibonacci_heap.merge(Node node1, Node node2)		
Description	Merge two circular doubly linked lists	
Parameters	1. Node 1 2. Node 2	1. First node to merge 2. Second node to merge
Return value	Max node of the merged circular doubly linked lists	

Node fibonacci_heap.test_linkedlist(Node first)		
Description	Utility function to test if a linked list containing the input node is correctly circular	
Parameters	1. First	3. One node of the linked list to check
Return value	None	

Node fibonacci_heap.test_max_node()		
Description	Utility function to peek max node	
Parameters	None	None
Return value	None	

Node fibonacci_heap.test_max_node()	
Description	Utility function to peek max node

Parameters	None	None
Return value	None	

boolean driver.is_first_file_open()		
Description	Function to check if the file is being opened for the first time for this test case	
Parameters	None	None
Return value	True if the file is being opened for the first time otherwise false.	

List<String> driver.read_lines_from_file(String file_name)		
Description	Function to read lines from a file	
Parameters	file_name	Name of the file to read
Return value	List of lines from the file	

driver.process_lines(List<String> lines_in_file)		
Description	This function instantiates the dictionary and the fibonacci heap and then calls the process_line_to_fibonacci_heap function for every line.	
Parameters	lines_in_file	A list of lines to process
Return value	None	

driver.one_by_one()		
Description	This function instantiates the dictionary and the fibonacci heap and then prompts the user for inputs to give to the process_line_to_fibonacci function till stop is called	
Parameters	None	None
Return value	None	

driver.process_line_to_fibonacci_heap(HashMap<String, Node> dicti, fibonacci_heap fib_heap, String line)		
Description	This function processes each line according to the logic - check if the node mentioned in the line exists in the dictionary and if it does then increment the frequency by the amount mentioned in the line otherwise make the node with the given frequency.	
Parameters	1. Dicti 2. Fib_heap 3. Line	1. Reference of the Dictionary to point to the nodes 2. Reference of the Fibonacci heap into which the nodes are inserted 3. Input line
Return value	None
